

Lab 4 — Capstone (Demo Day)

Demo Day: Thursday, August 27, 2026. Your exec sponsor and leadership attend to see what you’ve built — this is the formal capstone of the program.

Deliverable: one real, team-shareable artifact you own — putting everything from the program to work. **Duration:** self-built through week 6 (office hours + teaming up with other developers); one ~2-hr block at Demo Day. **Surface:** real code — this repo or your own team’s work.

The challenge. Pick **one** artifact from the menu, build it on real code, prove it in at least one real instance, commit and share it with the team, and present it at Demo Day.

Pick one artifact

Artifact	Ideas — anything like...	Build
Shareable skill or specialist subagent	things you explain twice: writing tests, drafting PR reviews, debugging a subsystem, scaffolding new code, release chores	solo
Governance / standards contribution — into the team’s Collective Brain	rules that live in someone’s head: naming, what “done” means, which doc to write when, how we work with Claude	solo
Guardrail / hook bundle — grow your Lab 2 hook into a team policy set	things reviewers keep catching by hand: protected files, risky commands, architecture rules, secrets	solo
Small workflow automation	chores you dread: environment setup, deploy steps, ticket grooming, status reports, form-filling	solo or paired
MCP server / connector	systems you keep copy-pasting from: tickets, databases, CI status, internal docs and APIs	solo or paired

Every option counts the same toward your capstone — pick whichever fits your real work. An MCP server can be a **small local script** (Python or Node) that Claude Code launches on your machine, or a **remote service** — either is a valid capstone. Start **read-only**, fewest useful operations, config included; prep is the self-paced *Extending Claude Code* module.

Evidence — the same three things for every artifact: an **impact note** in your own words (what it saves or improves — “before, this was all manual” is a fine story; numbers only if you have them), a **named teammate who will adopt it**, and a short **“how to use” README**.

Your 10 minutes on Demo Day (max, per developer or paired entry):

1. **Come on live** and share your screen.
2. **Introduce your artifact** — what it is and the problem it removes (~2 min).
3. **Practical demonstration** — run it on real work, live (~5 min).
4. **Questions & answers** from the room (~3 min).

Done means:

- ☐ one owned, committed, team-shared artifact from the menu
- ☐ used or validated in at least one real instance
- ☐ the three evidence items
- ☐ Demo Day presentation delivered — counts toward **Framework Practitioner** (a governance-doc capstone still certifies)

Stuck? “Nothing to automate” is fine — ship a skill, doc, or connector. Scope too big — build the smallest useful version (start from the automation-asks list or your Lab 2 work). No adopter yet — recruit one teammate. That’s the point.
